

In 2004, the world's bottled water usage was calculated to exceed **26,000,000,000** litres !!

That is nearly **28,000,000,000** plastic bottles in only one year of which 86% end up as garbage.

**17,000,000** barrels of oil were used to produce those plastic bottles That amount of oil is equivalent to fueling **100,000** cars for that entire year!

**2,500,000** tons of Carbon Dioxide were produced in the manufacturing of those bottles.

**1,500** WATER BOTTLES END UP AS GARBAGE EVERY SECOND.

**\$100,000,000** are spent every year by consumers on bottled water.

The people who cannot afford bottled water probably need cleaner water but have little choice

**BUT YOU DO**

How many bottles can be saved

by refilling water bottles?!  
How many can you save by doing very little work?
